

Versa Product Description

The Versa Operating System (VOS™) allows Customers to deploy a broad spectrum of software defined solutions including Secure SD-WAN and Secure Access Service Edge (SASE) in branch offices, cloud, campus and data centers. VOS is a cloud-native, multitenant, and multi-service software stack with a full set of networking capabilities, including SD-WAN and scalable routing, along with a range of integrated security functions – making it possible to design agile managed services and software-defined enterprise architectures.

Licenses are managed by Versa Director which provides life-cycle management, orchestration, and monitoring in a single application. Regardless of where VOS is deployed (on-premises or in the cloud), network and security capabilities are provisioned and managed centrally through the Versa Director, a single-pane-of-glass management platform.

Reporting is provided by Versa Analytics which provides holistic visibility, base-lining, correlation and predictive analysis for network, application usage and security events. With Versa Analytics, network security, application usage, export reports and logs are all analyzed, filtered and are searchable for events to help derive actionable insights.
