

Network-based protection for your IoT ecosystem

Fortify all data collection devices with Verizon IoT Security.

An ever-growing landscape

Cellular Internet of Things (IoT) devices are being implemented on a massive scale to help organizations collect and process enormous amounts of data in near real time. Survey results show that more than two-thirds of organizations see a clear correlation between their IoT implementations and return on investment (ROI).¹ In fact, deployments of 10,000+ devices are expected to grow by more than 250% in 2026,² reflecting strong momentum in large-scale adoption. This increase in cellular IoT implementation introduces significant exposure for enterprise operations and requires advanced security support from a trustworthy partner.

Helping secure your expanding IoT ecosystem

Verizon can help you strengthen IoT security with network-based protection designed to support your device environment at scale. With security built into the network, your teams can help reduce the risk of data breaches, apply protections more consistently and manage security in a way that is simpler and easier to maintain.

Security simplified

Verizon IoT Security is available for IoT devices and is integrated into the Verizon ThingSpace management portal. This network-native solution scales to secure thousands of distributed assets without modifying the devices themselves. To activate the service, simply add the security feature to a line of service and select the firewall settings in ThingSpace. You can quickly set default recommended settings or choose to further customize deployment. You also have visibility into the effectiveness of your security posture from the reporting of key metrics within ThingSpace.

Benefits for your enterprise

Help protect connected devices.

Get built-in network security to help protect IoT devices and have more secure operational data collection.

Support security compliance.

Put controls in place that help support evolving IoT security requirements.

Reduce the risk of security gaps.

Maintain resilient, continual data collection by helping prevent device and network downtime.

Simplify security.

Use one familiar portal to configure and maintain security without modifying devices.

Gain visibility.

Access reports on avoided threats to better plan your security profile.

Why Verizon?

With more than 25 years in the telecommunications industry and business innovation deeply ingrained in our DNA, we have the resources, expertise and passion to help future-proof your business. Our comprehensive IoT solutions are built to bolster your operation with a wide range of resilient capabilities – not niche, one-off features. Being partners means that you have Verizon's unwavering IoT support, future-ready technology and an evolving management platform.
