How can I change my VersaLink 7500 wireless network to WPA2 encryption?

Note: The configuration screens may vary slightly depending on when you purchased your VersaLink 7500 gateway and the version of firmware running on it.

1. Open your Web browser and enter http://192.168.1.1 in the Address field.

2. Click the Wireless Settings icon in the top toolbar.

3. Enter your VersaLink 7500 user name and password if prompted and click Ok.
4. Click **Advanced Security Settings** in the left navigation panel.

5. Select **WPA** in the Level 1 section to enable WPA2 network encryption.
6. Click **OK** if a pop-up message displays saying WPA is inactive.

![Message from webpage]

7. Confirm that Personal (Pre-Shared Key) is selected in the Authentication method field.

![Advanced Security Settings]

8. Select **WPA2** in the **WPA Type** field.
9. Select **WPA2 Pre-Authentication**.

10. Confirm that **Group Key Update Interval** is selected. One of the strengths of WPA2 encryption is that it self-generates a new key based on the original encryption key you enter. By enabling this field, you can control the time interval between the creation of the new encryption key.
11. Enter the number of seconds before a new encryption key is automatically generated in the **Seconds** field. You may want to consider an interval around 3600 seconds.

12. Enter your WPA encryption key in the **WPA Shared Key** field.

13. Click **Apply** to save your WPA2 settings.
